## ***New Product Bulletin – Blind Shelf Supports\****

***November, 2005***

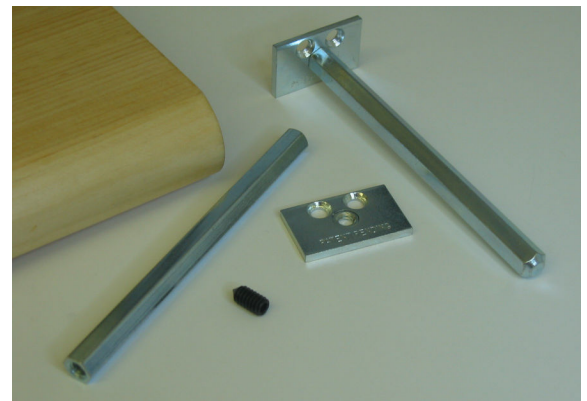

---

A pair of these blind shelf supports will invisibly hold a 1" or thicker shelf. Each mounting plate is anchored to the wall studs with two flat-head screws, and the projecting 5" long hex posts slip into 7/16" holes drilled in the back side of the shelf. Even if the holes end up slightly undersize, the corners of the hex post will cut their way in.

The design ensures that the alloy steel coupling screws remain tensioned between the posts and inserts in the plates, yielding a respectable capacity of 100 lb for a 4" deep shelf and up to 50 lb at 8" deep.

Additional supports are sold singly for increasing load capacity on shelves long enough to span more than two studs; each extra support adds 50 lb more capacity at 4" deep, and 25 lb more at 8" deep\*. Simple instructions included make installation a snap.
